

This document is meant to help integrating the financial hub developed by Intelliron Solutions Pvt. Ltd. into icarAsia's current setup. This doc assumes that icarAsia has Yii2 installed and running as front end architecture for its sites as informed by icarAsia's internal development team.

File folders are organized as per site. We worked it out for 3 sites: carlist.my, mobile123.com, one2car.com. Each site has 2 versions: Desktop and Mobile. Inside each desktop or mobile folder we have application files as per standard Yii2 folder structure.

Following description is for carlist.my desktop site. Same holds true for other 2 sites and mobile versions.

1. Inside Carlist.my > Desktop > common > messages contains all language files as per language code. Please use whichever suitable for each site. Inside each language code folder you will find "fhub.php" file which contains all language strings used in financial hub. You will find following code in Carlist.my > Desktop > common > config > main.php for language file mapping.

```
-----  
  
'i18n' => [  
    'translations' => [  
        'fhub' => [  
            'class' => 'yii\i18n\PhpMessageSource',  
            'basePath' => '../common/messages',  
            // 'sourceLanguage' => 'en-US',  
            'fileMap' => [  
                'fhub' => 'fhub.php',  
            ],  
        ],  
    ],  
],  
],
```

-----  
Now you will not need all language folders. Please use the one which you need.

2. All config variables related to Financial hub are stored in Carlist.my > Desktop > frontend > config > params-local.php file. You can change sponsor details etc. from there. Please go through the file to see what variables available.
3. To call the finance hub you will need to call the "index" action of CarfinanceController.php like following:

<http://myintelliron.com/projects/carlist/frontend/web/index.php?r=carfinance>

This file can be found in controller folder inside frontend folder.

4. We have also made a widget to include in any page of your portal. Code of this widget can be found in Carlist.my > Desktop > frontend > components folder. This widget has been made as per Yii2 standard. To use this widget you will need to call like following:

-----

```
<?= fhubWidget::widget();?>
```

-----

**Note: ClassifiedController.php has been created to show the use of widget, otherwise this controller does not have any use.**

5. To install the financial hub do the followings:
  - a. Copy Carlist.my>Desktop>common>messages>en>fhub.php to your installation's corresponding folder.
  - b. Then do the fhub.php file mapping in your common>config>main.php file as mentioned No. 1 section above. In case you have any different setup, please do as you need to make the language file available.
  - c. Copy Carlist.my>Desktop>frontend>config>params-local.php to your frontend>config folder. In case you already have some settings in that params-local.php, simply merge the config array.
  - d. Copy Carlist.my>Desktop>frontend>controllers>CarfinanceController.php to your controllers folder.
  - e. Copy Carlist.my>Desktop>frontend>views>carfinance folder to your views folder.
  - f. Copy fhub\_main.css, owl.carousel.css, tooltipster.css files from Carlist.my>Desktop>frontend>web>css folder to your css folder.
  - g. Copy fhub\_calculator.js, fhub\_main.js, fhub\_widget.js, jquery.tooltipster.min.js, owl.carousel.min.js files from Carlist.my>Desktop>frontend>web>js folder to your js folder.
6. Now call index action of CarfinanceController , finance hub will show up.
